Introduction

The connection between the Layouts, Widgets, and Activities is important within the Android scope. Having a view that has an event that sends information to other activity/fragment is one of the most used characteristics of Android. Every day, either on Instagram, WhatsApp, Telegram, etc, you are doing this simple but powerful task. Thus, the purpose of this Challenge is for you to have views in one fragment that change a view in another fragment.

All the resources that you need are available at UCStudent but feel free to use the resources/images. For any questions or doubts, you can send an e-mail to **joaonf@dei.uc.pt**.

Milestone 1

This first milestone is to be done in **groups**. The objectives are:
- Have an application that contains 2 fragments:
  - **Fragment 1**
    - Has a spinner that allows you to select an animal.
    - Can display the image of the selected animal.
    - Has three texts showing who is the owner, the name, and the age of the animal.
    - Has button to change to Fragment 2 but Fragment 1 does not send any information to Fragment 2 (except the selected position of the spinner which you need to know which animal was selected).
  - **Fragment 2**
    - Has two views that allow to enter a text and one view that allows to enter the age (hint: it is not a string value) of the animal.
    - Has a button to return to Fragment 1.
- **Every change made in Fragment 2 must be passed to Fragment 1's views** (e.g., if you change the name of the animal in Fragment 2, this must be reflected when you press the button to return to the Fragment 1). However, you do not need to have all three values (owner, name, and age) fulfilled in Fragment 2 (you can have only the name, for example).
- You must use **Dynamic Fragments** and **ViewModel.** Fragments must be instantiated in the Activity.

Deadlines and Evaluation
- The deadline is on October 7.
- There will not be any evaluation regarding this work. The evaluation will be based on the code that you submit to Inforestudante.
